Introduction

TUA/TUAE valves are made of stainless steel and are therefore very suitable for refrigeration systems in the food industry.

TUA/TUAE valves are available with interchangeable orifice assembly in straightway versions.

TUA/TUAE has been specially developed for soldering into hermetic refrigeration systems.

TUA/TUAE valves can be used in many different forms of refrigeration systems, for example:

- Traditional refrigeration systems
- Heat pump systems
- Air conditioning units
- Refrigeration appliances
- Liquid coolers
- Ice cube machines
- Mobile refrigeration systems

Features

- Interchangeable orifice assembly designed for:
 - Easy mounting
 - Optimized tightness
- Bimetal connections
 - Simple, fast soldering without the need for wet cloth or refrigeration pliers.
- Refrigerants
R22, R134a, R404A, R407C, R507, R410A and future refrigerants
- Capacities from 0.6 to 16 kW (0.17 to 4.5 TR) for R22
 - Large capacity range in small steps
- Stable regulation
- Biflow function (orifice 1 to 8)
- Compact design
 - small dimensions and low weight
- Stainless steel, solder version
 - high connection strength and tightness
 - capillary tube joints of high strength and vibration resistance
- Laser-welded, stainless steel thermostatic diaphragm element
 - optimum function
 - long diaphragm life
 - high pressure resistance
- Stainless steel bulb
 - simple and fast installation
 - good heat transfer from pipe to bulb
- Adjustable superheat
 - accurate setting
 - adjustable in operation
- Available with MOP (Max. Operating Pressure)
- Wide range of valves
- Interchangeable filter for easy cleaning
- Bleed orifices available on special request

Standard range

The standard range can be supplied in the following versions:

<i>Range N</i>	-40 to +10°C, without MOP
<i>Range N</i>	-40 to +10°C, MOP +15°C
<i>Range NM</i>	-40 to -5°C, MOP 0°C
<i>Range B</i>	-60 to -25°C, without MOP
<i>Range B</i>	-60 to -25°C, MOP -20°C

Valves for special temperature ranges can be supplied.

<i>Static superheat (SS) (R22, R134a, R404A, R407C and R410A):</i>	
Valves without MOP	5 K
Valves with MOP	4 K

<i>Static superheat (SS) (R507):</i>	
Valves without MOP	6.4 K
Valves with MOP	5.4 K
<i>Capillary tube length</i>	1.5 m
<i>Connections:</i>	
Inlet	1/4 in./6 mm
	3/8 in./10 mm
Outlet	1/2 in./12 mm

Technical data

<i>Max. bulb temperature</i>	100°C
<i>Max. valve body temp. short-lived peak</i>	120°C, 150°C
<i>Permissible working pressure (excl. R410A)</i>	PS = 34 bar
<i>Max. test pressure (excl. R410A)</i>	p' = 37.5 bar
<i>Max. working pressure, R410A</i>	PS = 42.5 bar
<i>Max. test pressure, R410A</i>	p' = 47 bar

Biflow drift

With flow in the opposite direction, the rated capacity is reduced by up to 15%.
TUAE with orifice 0 and 9, all TUA and valves with MOP charges cannot be used for biflow operation.

MOP valves

When MOP valves are used, to avoid charge migration the bulb temperature must always be lower than the thermostatic element temperature.

Correction for subcooling Δt_{sub}

The evaporator capacity used must be corrected if subcooling deviates from 4 K.

The corrected capacity can be obtained by dividing the evaporator capacity by the correction factor given below.

Correction factor for subcooling Δt_{sub}

Δt_{sub}	4 K	10 K	15 K	20 K	25 K	30 K	35 K	40 K	45 K	50 K
Correction factor	1.00	1.06	1.11	1.15	1.2	1.25	1.3	1.35	1.39	1.44

Note:

Insufficient subcooling can produce flash gas.

Selection example

Refrigerant = R22

 Evaporating temperature $t_e = -10^\circ\text{C}$

 Pressure drop in valve $\Delta p = 10$ bar

 Subcooling $\Delta t_{sub} = 15$ K

Evaporator capacity = 3 kW

Correction value (table) = 1.11

The corrected evaporator capacity thus becomes 3 divided by 1.11 = 2.7 kW

Since the expansion valve capacity must be equal to or slightly more than the corrected evaporator capacity of 2.7 kW, a TUB/TUBE with orifice 5 and a table capacity of 2.8 kW would be a suitable choice.

Correction for subcooling Δt_{sub}
 The evaporator capacity used must be corrected if subcooling deviates from 4 K. The corrected capacity can be obtained by dividing the evaporator capacity by the correction factor given below.

Note:
 Insufficient subcooling can produce flash gas.

Design/Function

1. Bulb with capillary tube
2. Thermostatic element with diaphragm
3. Setting spindle for adjustment of static superheat SS
4. Orifice assembly
5. Filter

Fig. 4

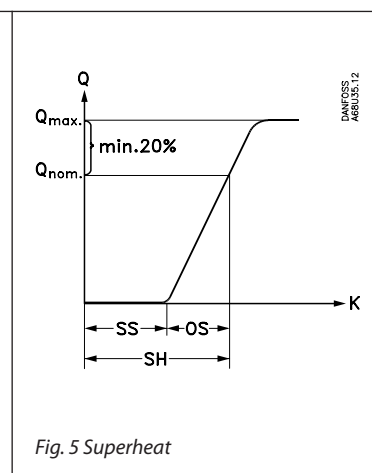

Fig. 5 Superheat

Superheat

See fig. 5

- SS = static superheat
- OS = opening superheat
- SH = SS + OS = total superheat
- Q_{nom} = rated capacity
- Q_{max} = maximum capacity

Static superheat SS can be adjusted with setting spindle 3, see fig. 4.

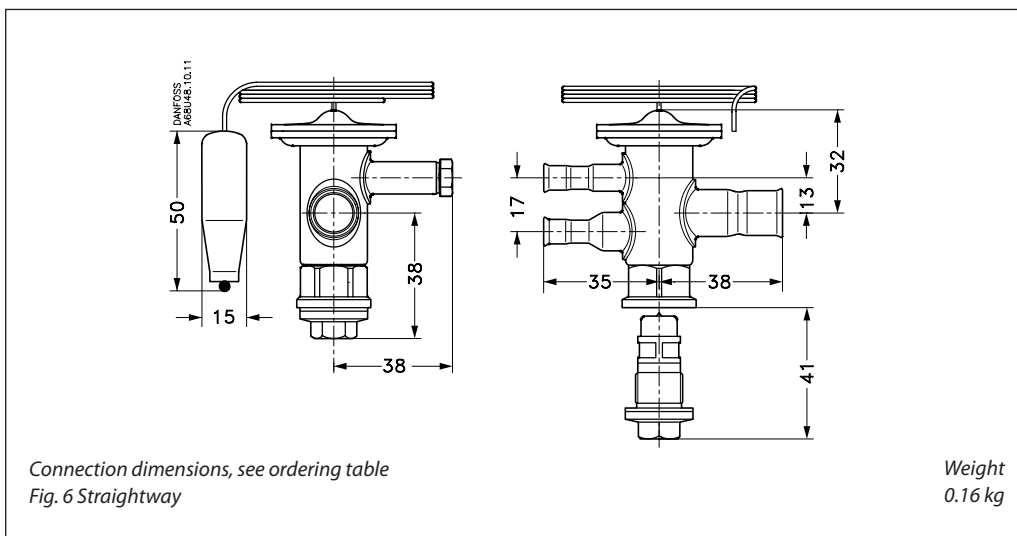

The standard superheat setting SS is 5 K for valves without MOP and 4 K for valves with MOP (except R507).

The opening superheat OS is 4 K from when opening begins to where the valve gives its rated capacity Q_{nom} .

Example

Static superheat	SS = 5 K
Opening superheat	OS = 4 K
